(57) **ABSTRACT**

A mobile terminal and controlling method thereof are disclosed, which facilitates a terminal to be used in further consideration of user's convenience. The present invention includes a touchscreen, a wireless communication unit configured to perform a wireless communication with at least one or more external terminals including a 1st external terminal, and a controller controlling a 1st image message including an image received from the 1st external terminal to be displayed on the touchscreen together with at least one of a previously saved transmitted message and a previously saved received message, the controller, if a 1st user command is inputted in the course of displaying the 1st image message, controlling a 1st memo to be written on the image of the received 1st image message.

MOBILE TERMINAL AND CORRESPONDING METHOD FOR TRANSMITTING MESSAGES WITH MEMOS WRITTEN THEREON

Pursuant to 35 U.S.C. §119(a), this application claims the benefit of earlier filing date and right of priority to Korean Application No. 10-2012-0041741, filed on Apr. 20, 2012, the contents of which are hereby incorporated by reference herein in their entirety.

BACKGROUND OF THE INVENTION

1. Field of the Invention

Embodiments of the present invention are related to a mobile terminal, and more particularly, to a mobile terminal and a method of controlling a mobile terminal. Although features disclosed herein are suitable for a wide scope of applications, they are particularly suitable for configuring a terminal in view of enhancing user convenience.

2. Discussion of the Related Art

A mobile terminal is a device which may be configured to perform various functions. Examples of such functions include data and voice communications, capturing images and video via a camera, recording audio, playing music files and outputting music via a speaker system, and displaying images and video on a display. Some terminals include additional functionality which supports game playing, while other terminals are also configured as multimedia players. More recently, mobile terminals have been configured to receive broadcast and multicast signals which permit viewing of contents, such as videos and television programs.

Generally, terminals can be classified into mobile terminals and stationary terminals according to their degree (e.g., ease) of mobility. Further, the mobile terminals can be further classified into handheld terminals and vehicle mount terminals according to the manner of portability.

There are ongoing efforts to support and increase the functionality of mobile terminals. Such efforts include software and hardware improvements, as well as changes and improvements in the structural components which form the mobile terminal.

Recently, a user further tends to use messages (e.g., short text message, instant message, email message, multimedia message etc.) rather than a voice call in communicating with a counterpart through a mobile terminal. And, it is necessary to research and develop methods for a user to utilize messages in a mobile terminal.

Conventionally, a message is generally constructed with texts or characters inputted by a user via hardware and/or software key buttons of a terminal. Eventually, if a user (especially, an elder person) is not used to key buttons, it may be inconvenient for the user to communicate with a counterpart using messages.

Moreover, when a user performs a message communication with a counterpart, it may be inconvenient for the user to write and send a memo on a prescribed image to the counterpart. In particular, if the image having the memo written thereon is the image received from the counterpart in the course of the ongoing message communication, it may be inconvenient for the user to write the memo on the received image and to send the complete memo to the counterpart again.

SUMMARY OF THE INVENTION

Accordingly, embodiments of the present invention are directed to a mobile terminal and controlling method thereof

2

that substantially obviate one or more problems due to limitations and disadvantages of the related art.

One object of the present invention is to provide a mobile terminal and controlling method thereof, by which a user not used to key buttons is facilitated to perform a communication with a counterpart via messages.

Another object of the present invention is to provide a mobile terminal and controlling method thereof, by which a memo can be conveniently sent to a counterpart in the course of an ongoing message communication in a manner of being written on an image.

A further object of the present invention is to provide a mobile terminal and controlling method thereof, by which a user is facilitated to view a memo written to a counterpart.

Additional advantages, objects, and features of the invention will be set forth in the disclosure herein as well as the accompanying drawings. Such aspects may also be appreciated by those skilled in the art based on the disclosure herein.

To achieve these objects and other advantages and in accordance with the purpose of the invention, as embodied and broadly described herein, a mobile terminal according to the present invention may include a touchscreen, a wireless communication unit configured to perform a wireless communication with at least one or more external terminals including a 1st external terminal, and a controller configured to display a 1st image message including an image received from the 1st external terminal on the touchscreen together with at least one of a previously saved transmitted message and a previously saved received message, and in response to a 1st user command inputted in the course of displaying the 1st image message, control a 1st memo to be written on the image of the received 1st image message.

In another aspect of the present invention, a method of controlling a mobile terminal according to the present invention may include performing a wireless communication with at least one or more external terminals including a 1st external terminal, displaying a 1st image message including an image received from the 1st external terminal on a touchscreen together with at least one of a previously saved transmitted message and a previously saved received message, and in response to a 1st user command inputted in the course of displaying the 1st image message, controlling a 1st memo to be written on the image of the received 1st image message.

In a further aspect of the present invention, an electronic recording medium according to the present invention may include 1st to 3rd commands encoded therein to be executed in a mobile terminal, wherein the 1st command is encoded to perform a wireless communication with at least one or more external terminals including a 1st external terminal, wherein the 2nd command is encoded to display a 1st image message including an image received from the 1st external terminal on a touchscreen together with at least one of a previously saved transmitted message and a previously saved received message, and wherein the 3rd command is encoded to control a 1st memo to be written on the image of the received 1st image message in response to a 1st user command inputted in the course of displaying the 1st image message.

Effects obtainable from the present invention may be non-limited by the above mentioned effect. And, other unmentioned effects can be clearly understood from the following description by those having ordinary skill in the technical field to which the present invention pertains. It is to be understood that both the foregoing general description and the following detailed description of the present inven-

3

tion are exemplary and explanatory and are intended to provide further explanation of the invention as claimed.

BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying drawings, which are included to provide a further understanding of the invention and are incorporated in and constitute a part of this application, illustrate embodiment(s) of the invention and together with the description serve to explain the principle of the invention. The above and other aspects, features, and advantages of the present invention will become more apparent upon consideration of the following description of preferred embodiments, taken in conjunction with the accompanying drawing figures. In the drawings:

FIG. 1 is a block diagram of a mobile terminal according to one embodiment of the present invention;

FIG. 2A is a front perspective diagram of a mobile terminal according to one embodiment of the present invention;

FIG. 2B is a rear perspective diagram of a mobile terminal according to one embodiment of the present invention;

FIG. 3 is a diagram of a communication environment for implementing one embodiment of the present invention;

FIG. 4 is a flowchart for a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 5 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 6 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 7 is a flowchart for a method of controlling a mobile terminal according to an embodiment of the present invention;

FIGS. 8 to 10 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 11 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 12 and FIG. 13 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 14 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention;

FIGS. 15 to 19 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 20 and FIG. 21 are diagrams of image messages transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention, respectively;

FIGS. 22 to 27 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention;

FIG. 28 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention; and

4

FIGS. 29 to 31 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

DETAILED DESCRIPTION OF THE INVENTION

In the following detailed description, reference is made to the accompanying drawing figures which form a part hereof, and which show by way of illustration specific embodiments of the invention. It is to be understood by those of ordinary skill in this technological field that other embodiments may be utilized, and structural, electrical, as well as procedural changes may be made without departing from the scope of the present invention. Wherever possible, the same reference numbers will be used throughout the drawings to refer to the same or similar parts.

As used herein, the suffixes 'module', 'unit' and 'part' are used for elements in order to facilitate the disclosure only. Therefore, significant meanings or roles are not given to the suffixes themselves and it is understood that the 'module', 'unit' and 'part' can be used together or interchangeably.

Features of embodiments of the present invention are applicable to various types of terminals. Examples of such terminals include mobile terminals, such as mobile phones, user equipment, smart phones, mobile computers, digital broadcast terminals, personal digital assistants, portable multimedia players (PMP) and navigators. However, by way of non-limiting example only, further description will be with regard to a mobile terminal 100, and it should be noted that such teachings may apply equally to other types of terminals such as digital TV, desktop computers and so on.

FIG. 1 is a block diagram of a mobile terminal 100 in accordance with an embodiment of the present invention. FIG. 1 shows the mobile terminal 100 according to one embodiment of the present invention includes a wireless communication unit 110, an A/V (audio/video) input unit 120, a user input unit 130, a sensing unit 140, an output unit 150, a memory 160, an interface unit 170, a controller 180, a power supply unit 190 and the like. FIG. 1 shows the mobile terminal 100 having various components, but it is understood that implementing all of the illustrated components is not a requirement. More or fewer components may be implemented according to various embodiments.

The wireless communication unit 110 typically includes one or more components which permits wireless communication between the mobile terminal 100 and a wireless communication system or network within which the mobile terminal 100 is located. For instance, the wireless communication unit 110 can include a broadcast receiving module 111, a mobile communication module 112, a wireless internet module 113, a short-range communication module 114, a position-location module 115 and the like.

The broadcast receiving module 111 receives a broadcast signal and/or broadcast associated information from an external broadcast managing server via a broadcast channel. The broadcast channel may include a satellite channel and a terrestrial channel. At least two broadcast receiving modules 111 can be provided in the mobile terminal 100 to facilitate simultaneous reception of at least two broadcast channels or broadcast channel switching.

The broadcast managing server is generally a server which generates and transmits a broadcast signal and/or broadcast associated information or a server which is provided with a previously generated broadcast signal and/or broadcast associated information and then transmits the

provided signal or information to a terminal. The broadcast signal may be implemented as a TV broadcast signal, a radio broadcast signal, and/or a data broadcast signal, among other signals. If desired, the broadcast signal may further include a broadcast signal combined with a TV or radio broadcast signal.

The broadcast associated information includes information associated with a broadcast channel, a broadcast program, or a broadcast service provider. Furthermore, the broadcast associated information can be provided via a mobile communication network. In this case, the broadcast associated information can be received by the mobile communication module 112.

The broadcast associated information can be implemented in various forms. For instance, broadcast associated information may include an electronic program guide (EPG) of digital multimedia broadcasting (DMB) and an electronic service guide (ESG) of digital video broadcast-handheld (DVB-H).

The broadcast receiving module 111 may be configured to receive broadcast signals transmitted from various types of broadcast systems. By nonlimiting example, such broadcasting systems may include digital multimedia broadcasting-terrestrial (DMB-T), digital multimedia broadcasting-satellite (DMB-S), digital video broadcast-handheld (DVB-H), digital video broadcast-convergence of broadcasting and mobile services (DVB-CBMS), Open Mobile Alliance Broadcast (OMA-BCAST), the data broadcasting system known as media forward link only (MediaFLO™) and integrated services digital broadcast-terrestrial (ISDB-T). Optionally, the broadcast receiving module 111 can be configured to be suitable for other broadcasting systems as well as the above-noted digital broadcasting systems.

The broadcast signal and/or broadcast associated information received by the broadcast receiving module 111 may be stored in a suitable device, such as the memory 160.

The mobile communication module 112 transmits/receives wireless signals to/from one or more network entities (e.g., base station, external terminal, server, etc.) via a mobile network such as GSM (Global System for Mobile communications), CDMA (Code Division Multiple Access), WCDMA (Wideband CDMA) and so on. Such wireless signals may represent audio, video, and data according to text/multimedia message transmissions, among others.

The wireless internet module 113 supports Internet access for the mobile terminal 100. This module may be internally or externally coupled to the mobile terminal 100. In this case, the wireless Internet technology can include WLAN (Wireless LAN) (Wi-Fi), Wibro (Wireless broadband), Wimax (World Interoperability for Microwave Access), HSDPA (High Speed Downlink Packet Access), GSM, CDMA, WCDMA, LTE (Long Term Evolution) etc.

Wireless internet access by Wibro, HSPDA, GSM, CDMA, WCDMA, LTE or the like is achieved via a mobile communication network. In this aspect, the wireless internet module 113 configured to perform the wireless internet access via the mobile communication network can be understood as a sort of the mobile communication module 112.

The short-range communication module 114 facilitates relatively short-range communications. Suitable technologies for implementing this module include NFC (Near Field Communication), radio frequency identification (RFID), infrared data association (IrDA), ultra-wideband (UWB), as well as the networking technologies commonly referred to as Bluetooth and ZigBee, to name a few.

The position-location module 115 identifies or otherwise obtains the location of the mobile terminal 100. If desired, this module may be implemented with a global positioning system (GPS) module.

According to the current technology, the GPS module 115 is able to precisely calculate current 3-dimensional position information based on at least one of longitude, latitude and altitude and direction (or orientation) by calculating distance information and precise time information from at least three satellites and then applying triangulation to the calculated information. Currently, location and time informations are calculated using three satellites, and errors of the calculated location position and time informations are then amended using another satellite. Besides, the GPS module 115 is able to calculate speed information by continuously calculating a real-time current location.

Referring to FIG. 1, the audio/video (A/V) input unit 120 is configured to provide audio or video signal input to the mobile terminal 100. As shown, the A/V input unit 120 includes a camera 121 and a microphone 122. The camera 121 receives and processes image frames of still pictures or video, which are obtained by an image sensor in a video call mode or a photographing mode. And, the processed image frames can be displayed on the display 151.

The image frames processed by the camera 121 can be stored in the memory 160 or can be externally transmitted via the wireless communication unit 110. Optionally, at least two cameras 121 can be provided to the mobile terminal 100 according to environment of usage.

The microphone 122 receives an external audio signal while the portable device is in a particular mode, such as phone call mode, recording mode and voice recognition. This audio signal is processed and converted into electric audio data. The processed audio data is transformed into a format transmittable to a mobile communication base station via the mobile communication module 112 in case of a call mode. The microphone 122 typically includes assorted noise removing algorithms to remove noise generated in the course of receiving the external audio signal.

The user input unit 130 generates input data responsive to user manipulation of an associated input device or devices. Examples of such devices include a keypad, a dome switch, a touchpad (e.g., static pressure/capacitance), a jog wheel, a jog switch, etc.

The sensing unit 140 provides sensing signals for controlling operations of the mobile terminal 100 using status measurements of various aspects of the mobile terminal. For instance, the sensing unit 140 may detect at least one of an ambient light around the mobile terminal 100, an open/close status of the mobile terminal 100, relative positioning of components (e.g., a display and keypad) of the mobile terminal 100, a change of position of the mobile terminal 100 or a component of the mobile terminal 100, a movement (and/or its trajectory) of the mobile terminal, a presence or absence of user contact with the mobile terminal 100, orientation or acceleration/deceleration of the mobile terminal 100. As an example, consider the mobile terminal 100 being configured as a slide-type mobile terminal. In this configuration, the sensing unit 140 may sense whether a sliding portion of the mobile terminal is open or closed. Other examples include the sensing unit 140 sensing the presence or absence of power provided by the power supply 190, the presence or absence of a coupling or other connection between the interface unit 170 and an external device. And, the sensing unit 140 can include a proximity sensor 141.

The output unit **150** generates outputs relevant to the senses of sight, hearing, touch and the like. And, the output unit **150** includes the display **151**, an audio output module **152**, an alarm unit **153**, and a haptic module **154** and the like.

The display **151** is typically implemented to visually display (output) information associated with the mobile terminal **100**. For instance, if the mobile terminal is operating in a phone call mode, the display will generally provide a user interface (UI) or graphical user interface (GUI) which includes information associated with placing, conducting, and terminating a phone call. As another example, if the mobile terminal **100** is in a video call mode or a photographing mode, the display **151** may additionally or alternatively display images which are associated with these modes, the UI or the GUI.

The display module **151** may be implemented using known display technologies including, for example, a liquid crystal display (LCD), a thin film transistor-liquid crystal display (TFT-LCD), an organic light-emitting diode display (OLED), a flexible display and a three-dimensional display. The mobile terminal **100** may include one or more of such displays.

Some of the above displays can be implemented in a transparent or optical transmittive type, which can be named a transparent display. As a representative example for the transparent display, there is TOLED (transparent OLED) or the like. A rear configuration of the display **151** can be implemented in the optical transmittive type as well. In this configuration, a user is able to see an object in rear of a terminal body via the area occupied by the display **151** of the terminal body.

At least two displays **151** can be provided to the mobile terminal **100** in accordance with the implemented configuration of the mobile terminal **100**. For instance, a plurality of displays can be arranged on a single face of the mobile terminal **100** in a manner of being spaced apart from each other or being built in one body. Alternatively, a plurality of displays can be arranged on different faces of the mobile terminal **100**.

In case that the display **151** and a sensor for detecting a touch action (hereinafter called 'touch sensor') configures a mutual layer structure (hereinafter called 'touchscreen'), it is able to use the display **151** as an input device as well as an output device. In this case, the touch sensor can be configured as a touch film, a touch sheet, a touchpad or the like.

The touch sensor can be configured to convert a pressure applied to a specific portion of the display **151** or a variation of a capacitance generated from a specific portion of the display **151** to an electric input signal. Moreover, it is able to configure the touch sensor to detect a pressure of a touch as well as a touched position or size.

If a touch input is made to the touch sensor, signal(s) corresponding to the touch is transferred to a touch controller. The touch controller processes the signal(s) and then transfers the processed signal(s) to the controller **180**. Therefore, the controller **180** is able to know whether a prescribed portion of the display **151** is touched.

Referring to FIG. 1, a proximity sensor **141** can be provided to an internal area of the mobile terminal **100** enclosed by the touchscreen or around the touchscreen. The proximity sensor is the sensor that detects a presence or non-presence of an object approaching a prescribed detecting surface or an object existing around the proximity sensor using an electromagnetic field strength or infrared ray without mechanical contact. Hence, the proximity sensor has durability longer than that of a contact type sensor and also has utility wider than that of the contact type sensor.

The proximity sensor can include one of a transmittive photoelectric sensor, a direct reflective photoelectric sensor, a mirror reflective photoelectric sensor, a radio frequency oscillation proximity sensor, an electrostatic capacity proximity sensor, a magnetic proximity sensor, an infrared proximity sensor and the like. In case that the touchscreen includes the electrostatic capacity proximity sensor, it is configured to detect the proximity of a pointer using a variation of electric field according to the proximity of the pointer. In this case, the touchscreen (touch sensor) can be classified as the proximity sensor.

For clarity and convenience of explanation, an action for enabling the pointer approaching the touchscreen to be recognized as placed on the touchscreen may be named 'proximity touch' and an action of enabling the pointer to actually come into contact with the touchscreen may be named 'contact touch'. And, a position, at which the proximity touch is made to the touchscreen using the pointer, may mean a position of the pointer vertically corresponding to the touchscreen when the pointer makes the proximity touch.

The proximity sensor detects a proximity touch and a proximity touch pattern (e.g., a proximity touch distance, a proximity touch duration, a proximity touch position, a proximity touch shift state, etc.). And, information corresponding to the detected proximity touch action and the detected proximity touch pattern can be outputted to the touchscreen.

The audio output module **152** functions in various modes including a call-receiving mode, a call-placing mode, a recording mode, a voice recognition mode, a broadcast reception mode and the like to output audio data which is received from the wireless communication unit **110** or is stored in the memory **160**. During operation, the audio output module **152** outputs audio relating to a particular function (e.g., call received, message received, etc.). The audio output module **152** is often implemented using one or more speakers, buzzers, other audio producing devices, and combinations thereof.

The alarm unit **153** is output a signal for announcing the occurrence of a particular event associated with the mobile terminal **100**. Typical events include a call received event, a message received event and a touch input received event. The alarm unit **153** is able to output a signal for announcing the event occurrence by way of vibration as well as video or audio signal. The video or audio signal can be outputted via the display **151** or the audio output unit **152**. Hence, the display **151** or the audio output module **152** can be regarded as a part of the alarm unit **153**.

The haptic module **154** generates various tactile effects that can be sensed by a user. Vibration is a representative one of the tactile effects generated by the haptic module **154**. Strength and pattern of the vibration generated by the haptic module **154** are controllable. For instance, different vibrations can be outputted in a manner of being synthesized together or can be outputted in sequence.

The haptic module **154** is able to generate various tactile effects as well as the vibration. For instance, the haptic module **154** generates the effect attributed to the arrangement of pins vertically moving against a contact skin surface, the effect attributed to the injection/suction power of air through an injection/suction hole, the effect attributed to the skim over a skin surface, the effect attributed to the contact with electrode, the effect attributed to the electrostatic force, the effect attributed to the representation of hold/cold sense using an endothermic or exothermic device and the like.

The haptic module **154** can be implemented to enable a user to sense the tactile effect through a muscle sense of finger, arm or the like as well as to transfer the tactile effect through a direct contact. Optionally, at least two haptic modules **154** can be provided to the mobile terminal **100** in accordance with the corresponding configuration type of the mobile terminal **100**.

The memory unit **160** is generally used to store various types of data to support the processing, control, and storage requirements of the mobile terminal **100**. Examples of such data include program instructions for applications operating on the mobile terminal **100**, contact data, phonebook data, messages, audio, still pictures (or photo), moving pictures, etc. And, a recent use history or a cumulative use frequency of each data (e.g., use frequency for each phonebook, each message or each multimedia) can be stored in the memory unit **160**. Moreover, data for various patterns of vibration and/or sound outputted in case of a touch input to the touchscreen can be stored in the memory unit **160**.

The memory **160** may be implemented using any type or combination of suitable volatile and non-volatile memory or storage devices including hard disk, random access memory (RAM), static random access memory (SRAM), electrically erasable programmable read-only memory (EEPROM), erasable programmable read-only memory (EPROM), programmable read-only memory (PROM), read-only memory (ROM), magnetic memory, flash memory, magnetic or optical disk, multimedia card micro type memory, card-type memory (e.g., SD memory, XD memory, etc.), or other similar memory or data storage device. And, the mobile terminal **100** is able to operate in association with a web storage for performing a storage function of the memory **160** on Internet.

The interface unit **170** is often implemented to couple the mobile terminal **100** with external devices. The interface unit **170** receives data from the external devices or is supplied with the power and then transfers the data or power to the respective elements of the mobile terminal **100** or enables data within the mobile terminal **100** to be transferred to the external devices. The interface unit **170** may be configured using a wired/wireless headset port, an external charger port, a wired/wireless data port, a memory card port, a port for coupling to a device having an identity module, audio input/output ports, video input/output ports, an ear-phone port and/or the like.

The identity module is the chip for storing various kinds of information for authenticating a use authority of the mobile terminal **100** and can include a Near Field Communication (NFC) Chip, User Identify Module (UIM), Subscriber Identity Module (SIM), Universal Subscriber Identity Module (USIM) and/or the like. A device having the identity module (hereinafter called 'identity device') can be manufactured as a smart card. Therefore, the identity device is connectible to the mobile terminal **100** via the corresponding port.

It is not mandatory for the identity module to be detachably attached to the mobile terminal via the interface unit **170**. Alternatively, the identity module may be permanently built as a sort of the memory unit **160** in the mobile terminal **100**.

When the mobile terminal **110** is connected to an external cradle, the interface unit **170** becomes a passage for supplying the mobile terminal **100** with a power from the cradle or a passage for delivering various command signals inputted from the cradle by a user to the mobile terminal **100**. Each of the various command signals inputted from the

cradle or the power can operate as a signal enabling the mobile terminal **100** to recognize that it is correctly loaded in the cradle.

The controller **180** typically controls the overall operations of the mobile terminal **100**. For example, the controller **180** performs the control and processing associated with voice calls, data communications, video calls, etc. The controller **180** may include a multimedia module **181** that provides multimedia playback. The multimedia module **181** may be configured as part of the controller **180**, or implemented as a separate component.

Moreover, the controller **180** is able to perform a pattern (or image) recognizing process for recognizing a writing input and a picture drawing input carried out on the touchscreen as characters or images, respectively.

The power supply unit **190** provides power required by the various components for the mobile terminal **100**. The power may be internal power, external power, or combinations thereof.

Various embodiments described herein may be implemented in a computer-readable medium using, for example, computer software, hardware, or some combination thereof. For a hardware implementation, the embodiments described herein may be implemented within one or more application specific integrated circuits (ASICs), digital signal processors (DSPs), digital signal processing devices (DSPDs), programmable logic devices (PLDs), field programmable gate arrays (FPGAs), processors, controllers, micro-controllers, microprocessors, other electronic units designed to perform the functions described herein, or a selective combination thereof. Such embodiments may also be implemented by the controller **180**.

For a software implementation, the embodiments described herein may be implemented with separate software modules, such as procedures and functions, each of which perform one or more of the functions and operations described herein. The software codes can be implemented with a software application written in any suitable programming language and may be stored in memory such as the memory **160**, and executed by a controller or processor, such as the controller **180**.

FIG. **2A** is a front perspective diagram of a mobile terminal according to one embodiment of the present invention.

The mobile terminal **100** shown in the drawing has a bar type terminal body. Yet, the mobile terminal **100** may be implemented in a variety of different configurations. Examples of such configurations include folder-type, slide-type, rotational-type, swing-type and combinations thereof. For clarity, further disclosure will primarily relate to a bar-type mobile terminal **100**. However such teachings apply equally to other types of mobile terminals.

Referring to FIG. **2A**, the mobile terminal **100** includes a case (casing, housing, cover, etc.) configuring an exterior thereof. In the present embodiment, the case can be divided into a front case **101** and a rear case **102**. Various electric/electronic parts are loaded in a space provided between the front and rear cases **101** and **102**. Optionally, at least one middle case can be further provided between the front and rear cases **101** and **102** in addition.

The cases **101** and **102** are formed by injection molding of synthetic resin or can be formed of metal substance such as stainless steel (STS), titanium (Ti) or the like for example.

A display **151**, an audio output unit **152**, a camera **121**, user input units **130/131** and **132**, a microphone **122**, an interface **180** and the like can be provided to the terminal body, and more particularly, to the front case **101**.

11

The display **151** occupies most of a main face of the front case **101**. The audio output unit **151** and the camera **121** are provided to an area adjacent to one of both end portions of the display **151**, while the user input unit **131** and the microphone **122** are provided to another area adjacent to the other end portion of the display **151**. The user input unit **132** and the interface **170** can be provided to lateral sides of the front and rear cases **101** and **102**.

The input unit **130** is manipulated to receive a command for controlling an operation of the terminal **100**. And, the input unit **130** is able to include a plurality of manipulating units **131** and **132**. The manipulating units **131** and **132** can be named a manipulating portion and may adopt any mechanism of a tactile manner that enables a user to perform a manipulation action by experiencing a tactile feeling.

Content inputted by the first or second manipulating unit **131** or **132** can be diversely set. For instance, such a command as start, end, scroll and the like is inputted to the first manipulating unit **131**. And, a command for a volume adjustment of sound outputted from the audio output unit **152**, a command for a switching to a touch recognizing mode of the display **151** or the like can be inputted to the second manipulating unit **132**.

FIG. 2B is a perspective diagram of a backside of the terminal shown in FIG. 2A.

Referring to FIG. 2B, a camera **121'** can be additionally provided to a backside of the terminal body, and more particularly, to the rear case **102**. The camera **121** has a photographing direction that is substantially opposite to that of the former camera **121** shown in FIG. 21A and may have pixels differing from those of the former camera **121**.

Preferably, for instance, the former camera **121** has low pixels enough to capture and transmit a picture of user's face for a video call, while the latter camera **121'** has high pixels for capturing a general subject for photography without transmitting the captured subject. And, each of the cameras **121** and **121'** can be installed at the terminal body to be rotated or popped up.

A flash **123** and a mirror **124** are additionally provided adjacent to the camera **121'**. The flash **123** projects light toward a subject in case of photographing the subject using the camera **121'**. In case that a user attempts to take a picture of the user (self-photography) using the camera **121'**, the mirror **124** enables the user to view user's face reflected by the mirror **124**.

An additional audio output unit **152'** can be provided to the backside of the terminal body. The additional audio output unit **152'** is able to implement a stereo function together with the former audio output unit **152** shown in FIG. 2A and may be used for implementation of a speakerphone mode in talking over the terminal.

A broadcast signal receiving antenna **116** can be additionally provided to the lateral side of the terminal body as well as an antenna for communication or the like. The antenna **124** constructing a portion of the broadcast receiving module **111** shown in FIG. 1 can be retractably provided to the terminal body.

A power supply unit **190** for supplying a power to the terminal **100** is provided to the terminal body. And, the power supply unit **190** can be configured to be built within the terminal body. Alternatively, the power supply unit **190** can be configured to be detachably connected to the terminal body.

A touchpad **135** for detecting a touch can be additionally provided to the rear case **102**. The touchpad **135** can be configured in a light transmittive type like the display **151**. In this case, if the display **151** is configured to output visual

12

information from both of its faces, the visual information is viewable via the touchpad **135** as well. The information outputted from both of the faces can be entirely controlled by the touchpad **135**. Alternatively, a display is further provided to the touchpad **135** so that a touchscreen can be provided to the rear case **102** as well.

The touchpad **135** is activated by interconnecting with the display **151** of the front case **101**. The touchpad **135** can be provided in rear of the display **151** in parallel. The touchpad **135** can have a size equal to or smaller than that of the display **151**.

In the disclosure presented herein, embodiments related to a method, which can be implemented in the mobile terminal **100**, for controlling the mobile terminal are described with reference to the accompanying drawings.

FIG. 3 is a diagram of a communication environment for implementing one embodiment of the present invention.

First of all, embodiments of the present invention can be implemented in the above-described mobile terminal or between at least two mobile terminals mentioned in the foregoing description.

For clarity of the following description, assume that message communications according to the embodiments of the present invention are implemented among 3 mobile terminals including a 1st mobile terminal **100-1** (or a 1st user 'Tom'), a 2nd mobile terminal (or a 2nd user 'Jane') and a 3rd mobile terminal (or a 3rd user 'Sam') for example. If necessary, '1st', and '-1' shall be attached to components and reference numbers of the 1st mobile terminal **100-1**, '2nd' and '-2' shall be attached to components and reference numbers of the 2nd mobile terminal **100-1**, and '3rd' and '-3' shall be attached to components and reference numbers of the 1st mobile terminal **100-1**, respectively. For instance, a controller of the 1st mobile terminal **100-1** shall be named a 1st controller with a reference number **180-1**, a controller of the 2nd mobile terminal **100-2** shall be named a 2nd controller with a reference number **180-2**, and a controller of the 3rd mobile terminal **100-3** shall be named a 3rd controller with a reference number **180-3**.

Moreover, if the display module **151** includes a touchscreen, implementation of the following embodiments may be further facilitated. Therefore, the following description is made on the assumption that the display module **151** includes a touchscreen.

In particular, a reference number **400** shall refer to a display screen of a 1st touchscreen **151-1**, a reference number **600** shall refer to a display screen of a 2nd touchscreen **151-2**, and a reference number **900** shall refer to a display screen of a 3rd touchscreen **151-3**, in the following description.

FIG. 4 is a flowchart for a method of controlling a mobile terminal according to an embodiment of the present invention. FIG. 5 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention. And, FIG. 6 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 4 and FIG. 5, while a map application is active in the 1st mobile terminal **100-1** for example, assume that a map screen is displayed on the 1st touchscreen **400** [S41] [FIG. 5 (5-1)]. In the following description, the map screen shall be named a 1st screen. In particular, the 1st screen may include a full screen displayed on the 1st touchscreen **400** or a partial screen displayed on the 1st touchscreen **400**. Moreover, the 1st screen may include a full screen displayed on the 1st touchscreen **400** except various

13

indicators (e.g., reception strength indicator, power indicator, time indicator, etc.) **401** displayed thereon. For clarity of the following description, assume that the 1st screen includes the full screen displayed on the 1st touchscreen **400**.

The map screen may be the 1st screen just for example. Any screen (e.g., an internet browser screen, a multimedia play screen for video, still image, broadcast, music or the like, a camera preview image, a document screen, a home screen, a menu screen, etc.) displayable on the 1st touchscreen **400** in the course of using the 1st mobile terminal **100-1** can become the 1st screen.

For clarity, assume that the 1st screen is currently in display mode. Besides, the display mode shall be described later.

Subsequently, a 1st user command may be inputted to the 1st mobile terminal **100-1** [S43]. In this case, the 1st user command is provided to switch a mode of the 1st screen from the display mode to an editing mode. The editing mode shall be described later.

In particular, if a software key button (not shown in the drawing) prepared on the touchscreen **400** is pressed or a specific touch gesture (e.g., a simple touch, a double touch, a touch drag along a specific trace, etc.) is performed on the touchscreen **400**, the 1st user command may be inputted. Alternatively, if a specific hardware key button provided to the 1st mobile terminal **100-1** is pressed, the 1st user command may be inputted. Moreover, no limitation may be put on a method of inputting the 1st user command.

As the 1st screen enters the editing mode from the display mode, the 1st controller **180-1** may control the 1st screen to become a single image [S45, S47]. In this case, 'the 1st screen becomes the single image' may mean that the 1st screen becomes a memo background image or screen on which a memo can be written by a user with handwriting irrespective of graphic element type(s) (e.g., at least one of at least one text object, at least one image object, at least one link object and the like) configuring the 1st screen. And, if the 1st screen enters the editing mode, it may be understood that the 1st screen is captured to be used as the memo background image.

Subsequently, referring to FIG. 5 (5-2), a 1st user may be able to handwrite a 1st memo **511** on the 1st screen displayed on the 1st touchscreen **400** using such a pointer as a stylus pen **310**, a finger and the like [S49].

In response to the 1st memo **511** inputted onto the 1st screen, the 1st controller **180-1** may control a line to be drawn on the 1st touchscreen **400** along a trace of the 1st memo **511**. Hence, the 1st user may be able to check the 1st memo **511** by viewing the line drawn along the trace on the 1st touchscreen **400**.

Thereafter, a 2nd user command may be inputted to the 1st mobile terminal **100-1**. In particular, if a software key button **403**, which is generated from the touchscreen **400** when the 1st screen enters the editing mode, is pressed or a specific touch gesture (e.g., a simple touch, a double touch, a touch drag along a specific trace, etc.) is performed on the touchscreen **400**, the 2nd user command may be inputted. Alternatively, if a specific hardware key button provided to the 1st mobile terminal **100-1** is pressed, the 1st user command may be inputted. Moreover, no limitation may be put on a method of inputting the 2nd user command.

If so, the 1st controller **180-1** may control a contact list **405** to be displayed on the 1st touchscreen **400** [FIG. 5 (5-3)].

If a 2nd user (e.g., Jane) is touched and selected from the displayed contact list **405**, the 1st controller **180-1** may be able to control the 1st memo written 1st screen (hereinafter

14

named a 1st image message) to be transmitted to the 2nd mobile terminal **100-2** from the 1st mobile terminal **100-1** [S51, S53].

After the 1st image message has been transmitted, referring to FIG. 5 (5-4), the 1st controller **180-1** controls a message chat window, which is provided for a message chat with the 2nd user, to be displayed and may control the 1st image message to be displayed as a 1st transmitted message **413** on the message chat window [S55]. In doing so, the 1st transmitted message **413** may be displayed in a manner of being sorted or arranged in the message chat window in accordance with a corresponding transmission time.

As mentioned in the foregoing description, if the 1st screen is in the display mode, it may mean that it is impossible to handwrite a memo on the 1st screen. On the contrary, if the 1st screen is in the editing mode, it may mean that it is possible to handwrite a memo on the 1st screen.

In the following description, the 1st image message **501** transmitted from the 1st mobile terminal **100-1** to the 2nd mobile terminal **100-2** is explained in detail with reference to FIG. 6.

Referring to FIG. 6, the 1st image message **501** may include a 1st screen layer **510** containing a 1st screen (i.e., the memo background screen) and a 1st memo layer **515** containing a 1st memo **511**. And, at least one of a time of transmitting the 1st memo layer **515** and a 1st mobile terminal identifier information (or a 1st user identifier information) of the 1st mobile terminal **100-1**, by which the 1st memo **511** is written, may be included in the 1st image message **501** (or the 1st memo layer **515**). How to utilize the transmission time and the identifier information shall be described later.

The 2nd mobile terminal **100-2** receives the 1st image message **501** (i.e., the 1st screen layer **510** and the 1st memo layer **515**) and may be then able to display the received 1st image message **501** as a 1st received message **413** in a manner of superposing the 1st memo layer **515** on the 1st screen layer **510**. Subsequently, the 2nd mobile terminal **100-2** writes a reply message using the received 1st image message **501** and may be then able to transmit the reply message to the 1st mobile terminal **100-1**. This shall be described in detail with reference to FIGS. 7 to 11 as follows.

FIG. 7 is a flowchart for a method of controlling a mobile terminal according to an embodiment of the present invention. FIGS. 8 to 10 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention. And, FIG. 11 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 8 (8-1), the 2nd mobile terminal **100-2** receives the 1st image message transmitted by the 1st mobile terminal **100-1**. And, a 2nd controller **180-2** may control the 1st image message to be displayed as a 1st received message **613** on a message chat window, which is provided for a message chat with a 1st user, displayed on a 2nd touchscreen **600** [S71, S73]. In doing so, the 1st received message **613** may be displayed on the message chat window in a manner of being sorted or arranged in order of transmitted/received time together with at least one of at least one transmitted message, which is previously transmitted to a 1st user and saved in the memory unit **160**, and at least one received message, which is previously received from the 1st user and saved in the memory unit **160**.

In this case, the 1st image message (or a 1st screen) is displayed in display mode on the message chat window.

15

Hence, the 2nd controller **180-2** may control a memo not to be handwritten on the 1st image message by a 2nd user [S75, S77].

A 3rd user command for the 1st received message **613** may be inputted. In this case, the 3rd user command may include a user command for enlarging and displaying the 1st received message **613**. In particular, if a specific touch gesture (e.g., a simple touch, a double touch, a touch drag along a specific trace, etc.) is performed for the 1st received message **613**, the 3rd user command may be inputted. Alternatively, if a specific hardware key button provided to the 2nd mobile terminal **100-2** is pressed, the 3rd user command may be inputted. No limitation may be put on a method of inputting the 3rd user command.

If so, in response to the 3rd user command, referring to FIG. **8 (8-2)**, the 1st image **501** may be displayed in an increased size to enable the 2nd user to view the 1st image message **501** in further detail. In the example shown in FIG. **8 (8-2)**, since the 1st image message **501** is enlarged, other received or transmitted messages previously saved are not viewable, by which the present embodiment may be non-limited. And, it is a matter of course that the 1st image message **501** can be enlarged to be viewable together with other previously saved received or transmitted messages.

The enlarged 1st image message is still in the display mode. Hence, the 2nd controller **180-2** may control a memo not to be handwritten on the enlarged image message by the 2nd user as well.

When the 1st image message **501** is enlarged and displayed, the 2nd controller **180-2** may control a chat window return icon **607** to be displayed on the touchscreen **600**. Hence, if the 2nd user touches and selects the chat window return icon **607**, referring now to FIG. **8 (8-1)**, the 2nd controller **180-2** may control the chat window, on which the 1st image message **501** is displayed as the 1st received message **613**, to be displayed again.

In the following description, the 1st image message in the display mode is explained in detail with reference to FIG. **9**.

Referring to FIG. **9 (9-1)**, while the 1st image message **501** is displayed as the 1st received message **613** on the 2nd touchscreen **600**, a touch drag in top-to-bottom direction with a pointer may be inputted onto the 1st message image **501**.

Since the 1st image message **613** is in the display mode, the 2nd controller **180-2** may control any memo or handwriting not to be performed on the 1st image message **501** in response to the touch drag.

Instead, referring to FIG. **9 (9-2)**, in response to the top-to-bottom touch drag, the 2nd controller **180-2** may control a chat window, which is displayed on the touchscreen **600**, to be scrolled in the top-to-bottom direction.

In the following description, a process for changing or switching the mode of the 1st image message to an editing mode from the display mode is explained with reference to FIG. **10**.

Referring to FIG. **10 (10-1)**, while the 1st image message **501** is displayed as the 1st received message **613** on the 2nd touchscreen **600**, a 4th user command may be inputted for the 1st image message **501** (or the 1st received message **613**). In this case, the 4th user command may include a user command for switching a mode of the 1st image message **501** from the display mode to the editing mode [S75]. In particular, if a specific touch gesture (e.g., a simple touch, a double touch, a touch drag along a specific trace, etc.) is performed on the 1st image message **501** (or the 1st received message **613**), the 4th user command may be inputted. Alternatively, if a specific hardware key button provided to

16

the 2nd mobile terminal **100-2** is pressed, the 4th user command may be inputted. Moreover, no limitation may be put on a method of inputting the 4th user command.

FIG. **10 (10-1)** shows one example that the 4th user command includes a touch & drag performed on one corner of the 1st image message **501** (or the 1st received message **613**) in outer direction thereof.

Referring to FIG. **10 (10-2)**, in response to the touch drag of the 2nd user command, the 2nd controller **180-2** controls the 1st image message **501** to be enlarged in proportion to a length of the touch drag and may be also able to control the enlarged 1st image message **501** to enter an editing mode from a display mode. Besides, when a touch drag is performed in a manner of touching the corner of the enlarged 1st image message **501** and then performing a drag in inner direction thereof, the 2nd controller **180-2** controls the enlarged 1st image message **501** to return to its original size and may be also able to control the 1st image message **501** to return to the display mode from the editing mode [not shown in the drawing].

When the mode of the 1st image message **501** is switched to the editing mode, referring to FIG. **10 (10-3)**, the 2nd user may be able to handwrite a 2nd memo **521** on the enlarged 1st image message **501** displayed on the 2nd touchscreen **600** using a pointer **310** [S79].

In response to the 2nd memo **521** inputted onto the 1st image message **501**, the 2nd controller **180-2** may control a line to be drawn on the 2nd touchscreen **600** along a trace of the 2nd memo **521**. Therefore, a terminal user is able to check the 2nd memo **521** by viewing the line drawn along the trace on the 2nd touchscreen **600**.

If an icon 'Send' **623** provided to the chat window on the 2nd touchscreen **600** is touched by the 2nd user, the 2nd controller **180-2** may be able to control the 1st image message **501** (hereinafter named a 2nd image message **502**) having the 2nd memo **521** written thereon to be sent to the 1st mobile terminal **100-1** from the 2nd mobile terminal **100-2** [S81].

After the 2nd image message **502** has been sent, referring to FIG. **10 (10-4)**, the 2nd controller **180-2** may control the 2nd image message **502** to be instantly displayed as a 2nd transmitted message **615** on the message chat window for the message chat with the user [S83].

In the following description, the 2nd image message **502** sent to the 1st mobile terminal **100-1** from the 2nd mobile terminal **100-2** is explained in detail with reference to FIG. **11**.

First of all, the 2nd image message **502** may include a 1st screen layer **510** containing a 1st screen (i.e., the memo background screen), a 1st memo layer containing a 1st memo **511**, and a 2nd memo layer **525** containing a 2nd memo **521**. In the 2nd memo layer **525**, at least one of a time of transmitting the 2nd memo layer **525** and a 2nd mobile terminal identifier information (or a 2nd user identifier information) of the 2nd mobile terminal having the 2nd memo **521** written therein may be included. Utilization of the transmission time and the identifier information shall be described later.

The 1st mobile terminal **100-1** receives the 2nd image message **502** and may be then able to display the received 2nd image message **502** as a 2nd received message **415** in a manner of superposing the 1st memo layer **515** and the 2nd memo layer **525** over the 1st screen layer **510**. Subsequently, the 1st mobile terminal **100-1** writes a reply message using the received 2nd image message **502** and may be then able to

17

transmit the reply message to the 2nd mobile terminal 100-2. This shall be described in detail with reference to FIG. 12 and FIG. 13 as follows.

FIG. 12 and FIG. 13 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 12 (12-1), the 1st mobile terminal 100-1 receives the 2nd image message 502 transmitted by the 2nd mobile terminal 100-2. And, the 1st controller 180-1 may control the 2nd image message 502 to be displayed as a 2nd received message 415 on the message chat window displayed on the 1st touchscreen 400, which is provided for a message chat with a 2nd mobile terminal 100-2.

In this case, the 2nd image message is displayed in display mode on the message chat window. Hence, the 1st controller 180-1 may control a memo not to be handwritten on the 1st image message by the 1st user.

A 3rd user command for enlarging and displaying the 2nd received message 415 may be inputted. For clarity, since the 3rd user command is mentioned in the foregoing description, it details shall be omitted from the following description.

If so, as mentioned in the foregoing description, in response to the 3rd user command, referring to FIG. 12 (12-2), the 2nd image 502 may be displayed in an increased size.

The enlarged 2nd image message 502 is still in the display mode. Hence, the 1st controller 180-1 may control a memo not to be handwritten on the enlarged 2nd image message 502 by the 1st user as well.

While the 2nd image message 502 is enlarged and displayed, if a chat window return icon 407 displayed on the touchscreen 400 is touched, referring now to FIG. 12 (12-1), the 1st controller 180-1 may control a chat window, on which the 2nd image message 502 is displayed as the 2nd received message 415, to be displayed.

In the following description, a process for changing or switching the mode of the 2nd image message from the display mode to the editing mode is explained with reference to FIG. 13.

Referring to FIG. 13 (13-1), while the 2nd image message 502 is displayed as the 2nd received message 415 on the 1st touchscreen 400, a 4th user command may be inputted to switch mode of the 2nd image message to the editing mode from the display mode. Since the 4th user command is mentioned in the foregoing description, its details shall be omitted from the following description.

FIG. 13 (13-1) shows one example that the 4th user command includes a touch & drag performed on one corner of the 2nd image message 502 (or the 2nd received message 415) in outer direction thereof.

Referring to FIG. 13 (13-2), in response to the touch drag of the 4th user command, the 1st controller 180-1 controls the 2nd image message 502 to be enlarged in proportion to a length of the touch drag and may be also able to control the enlarged 2nd image message 502 to enter the editing mode from the display mode. Besides, as mentioned in the foregoing description, when a touch drag is performed in a manner of touching the corner of the enlarged 2nd image message 502 and then performing a drag in inner direction thereof, the 1st controller 180-1 controls the enlarged 2nd image message 502 to return to its original size and may be also able to control the 2nd image message 502 to return to the display mode from the editing mode.

When the mode of the 2nd image message 502 is switched to the editing mode, referring to FIG. 13 (13-2), the 1st user

18

may be able to handwrite a 3rd memo 531 on the enlarged 2nd image message 502 displayed on the 1st touchscreen 400 using a pointer 310.

In response to the 3rd memo 531 inputted onto the 2nd image message 502, the 1st controller 180-1 may control a line to be drawn on the 1st touchscreen 400 along a trace of the 3rd memo 531. Therefore, the 1st user is able to check the 3rd memo 531 by viewing the line drawn along the trace on the 1st touchscreen 400.

If an icon 'Send' 423 provided to the chat window on the 1st touchscreen 400 is touched by the 1st user, the 1st controller 180-1 may be able to control the 2nd image message 502 (hereinafter named a 3rd image message 503) having the 3rd memo 531 written thereon to be sent from the 1st mobile terminal 100-1 to the 2nd mobile terminal 100-2.

After the 3rd image message 503 has been sent, referring to FIG. 13 (13-3), the 1st controller 180-1 may control the 3rd image message 503 to be instantly displayed as a 3rd transmitted message 417 on the message chat window for the message chat with the 2nd user.

Meanwhile, when the 3rd image message 503 is transmitted to the 2nd mobile terminal 100-2 from the 1st mobile terminal 100-1, the 3rd image message 503 can be simultaneously transmitted not only to the 2nd mobile terminal 100-2 (or the 2nd user) but also to the 3rd mobile terminal 100-3 (or the 3rd user) by batch arrival. Alternatively, the 3rd image message 503 may be delivered to the 3rd mobile terminal 100-3 only. This may be possible if the 3rd mobile terminal 100-3 is additionally designated as a recipient of the 3rd image message 503 from the 1st mobile terminal 100-1 or the 3rd mobile terminal 100-3 is designated instead of the 2nd mobile terminal 100-2, in response to an appropriate user command. For clarity, since how to simultaneously send a prescribed message to at least two counterparts by batch arrival or how to send a prescribed message to a 3rd party counterpart can be easily understood by those skilled in the art, their details shall be omitted from the following description.

In the following description, how to simultaneously send the 3rd image message 503 from the 1st mobile terminal 100-1 to both of the 2nd mobile terminal 100-2 and the 3rd mobile terminal 100-3 by batch arrival is explained in detail with reference to FIG. 14.

FIG. 14 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 14, the 3rd image message 503 may include a 1st screen layer 510 containing a 1st screen (i.e., the memo background screen), a 1st memo layer 515 containing a 1st memo 511, a 2nd memo layer 525 containing a 2nd memo 521 and a 3rd memo layer 535 containing a 3rd memo 531. In the 3rd memo layer 535, at least one of a time of transmitting the 3rd memo layer 535 and a 1st mobile terminal identifier information (or a 1st user identifier information) of the 1st mobile terminal having the 3rd memo 531 written therein may be included.

In the following description, the 2nd image message 502 received by the 1st mobile terminal 100-1 in the editing mode is explained in detail with reference to FIG. 15.

FIG. 15 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 15 (15-1), while the 2nd image message 502 is being displayed as the 2nd received message 415 on the 1st touchscreen 400, a 4th user command may be inputted to switch the mode of the 2nd image message 502 to the editing mode from the display mode.

If so, referring to FIG. 15 (15-2), the 1st controller 180-1 may control the 1st memo 511 and the 2nd memo 521 to be simultaneously viewed as originally written forms in the 2nd image message 502 having entered the editing mode. In this case, the 1st user may have difficulty in recognizing which one of the 1st memo 511 and the 2nd memo 521 is the recent one or which one of the 1st memo 511 and the 2nd memo 521 is written by the 1st user.

Hence, referring to FIG. 15 (15-3), the 1st controller 180-1 may control the most recently written 2nd memo 521 to be displayed on the 2nd image message 502 having entered the editing mode in a manner of being visually discriminated from the 1st memo 511 written ahead of the 2nd memo 521. FIG. 15 (15-3) shows one example that the most recently written 2nd memo 521 is displayed thicker or bolder than the 1st memo 511 written ahead of the 2nd memo 521.

Besides, in case that at least 3 memos exist in the editing mode entered 2nd image message 502, they can be displayed increasingly thick in a manner that the latest memo is displayed thickest or boldest and that the earliest memo is displayed least thick.

In a certain case, on the editing mode entered 2nd image message 502, the most recently written 2nd memo 521 only may be displayed. Alternatively, if the 2nd image message 502 enters the editing mode within a prescribed time from a reception time of the 2nd image message 502, the most recently written 2nd memo 521 is displayed only, and if the 2nd image message 502 enters the editing mode after prescribed duration from a reception time of the 2nd image message 502, all the memos including the 2nd memo can be displayed.

If a prescribed duration of the 1st memo or the 2nd memo expires from its corresponding creation time, the 1st controller 180-1 may be able to control the corresponding memo to disappear from the editing mode entered 2nd image message 502 displayed on the corresponding touchscreen gradually or immediately.

Alternatively, when a prescribed number of memo layers or more are cumulated on the 1st screen (or memo background) layer, the 1st controller 180-1 may control the oldest memo layer to disappear from the touchscreen gradually or instantly.

The memo layer disappearing from the 2nd image message in the editing mode may not be viewable despite that the mode of the 2nd image message is switched to the display mode.

Alternatively, the memo layer disappearing from the 2nd image message in the editing mode is not viewable only despite existing. Thus, if the 2nd image message enters the display mode, the corresponding memo layer may become viewable again. Hence, after a 3rd memo has been written on the 2nd image message in the editing mode, even if the 2nd image message (i.e., the 3rd image message) having the 3rd memo written thereon is transmitted to a counterpart, the unseen memo layer can be still transmitted to the counterpart.

Moreover, the 1st controller 180-1 may be able to control the 2nd memo 521, which is written by the counterpart (e.g., the 2nd user) to be displayed on the editing mode entered 2nd image 502 in a manner of being visually discriminated from the 1st memo 511 written by the corresponding user (e.g., the 1st user).

In the following description, how the 1st image message 501 received by the 2nd mobile terminal 100-2 enters the editing mode from the display mode is in detail explained with reference to FIG. 16.

FIG. 16 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 16 (16-1), while the 1st image 501 is displayed as the 1st received message 613 on the 2nd touchscreen 600, a 4th user command for switching the mode of the 1st image message 501 to the editing mode from the display mode may be inputted. In this case, assume that the 4th user command includes a touch drag performed in a manner of touching and then dragging a prescribed corner of the 1st image message 501 (or the 1st received message 613) in outer direction thereof.

In response to the 4th user command, the 2nd controller 180-2 may be able to calculate a length of the touch drag in the outer direction.

If the calculated length of the touch drag is equal to or smaller than a prescribed length, referring to FIG. 16 (16-2), the 2nd controller 180-2 may be able to control the editing mode entered 1st received message 613 to be enlarged enough to be viewed together with other transmitted and/or received messages saved previously.

On the contrary, if the calculated length of the touch drag is greater than the prescribed length, referring to FIG. 16 (16-3), the 2nd controller 180-2 may be able to control the editing mode entered 1st received message 613 to be enlarged enough to be viewed only without other transmitted and/or received messages saved previously.

In the following description, how the 1st image message 501 received by the 2nd mobile terminal 100-2 enters the editing mode from the display mode is explained in detail with reference to FIG. 17 and FIG. 18.

FIG. 17 and FIG. 18 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

First of all, as mentioned in the forgoing description with reference to FIG. 16 (16-1), while the 1st image 501 is displayed as the 1st received message 613 on the 2nd touchscreen 600, a prescribed corner of the 1st image message 501 (or the 1st received message 613) may be touched and then dragged in outer direction thereof.

In response to the touch drag in the outer direction, referring to FIG. 17 (17-1), the 2nd controller 180-2 only controls the 1st image message 501 to be enlarged and may be also able to control the 1st image message 501 to keep staying in the display mode. When the 1st image message 501 is enlarged and displayed, the 2nd user may be able to perform a top-to-bottom touch drag on the enlarged 1st image message 501 with a finger 320.

If so, the 2nd controller 180-2 calculates a contact area of the pointer (e.g., the finger) with which the top-to-bottom touch drag is performed.

If the calculated contact area is equal to or greater than a predetermined area, the 2nd controller 180-2 may control the 1st image message 501 to keep staying in the display mode.

Therefore, referring to FIG. 17 (17-2), the 2nd controller 180 may be able to control the chat window to be scrolled in response to the top-to-bottom touch drag.

Meanwhile, referring to FIG. 18 (18-1), while the 1st image message 501 is enlarged and displayed, the 2nd user may perform a touch drag in top-to-bottom direction on the enlarged 1st image message 501 with a stylus pen 310 for example.

If so, the 2nd controller 180-2 may calculate a contact area (or thickness) of the pointer (i.e., the stylus pen) with which the top-to-bottom touch drag is performed.

21

If the calculated contact area is equal to or smaller than a predetermined area, the 2nd controller 180-2 may control the display mode of the 1st image message 501 to be switched to the editing mode.

Therefore, referring to FIG. 18 (18-2), the 2nd controller 180 may be able to control a handwriting to be inputted onto the 1st image message 501 in response to the top-to-bottom touch drag.

According to the above description, whether to switch to the editing mode of the 1st image message is determined depending on the contact area of the pointer applied to the touchscreen, by which the present embodiment may be non-limited. For instance, whether to switch to the editing mode of the 1st image message can be determined depending on one of a pressure, moving speed and capacitance of the pointer applied to the touchscreen.

According to the above description, in the 2nd mobile terminal 100-2, a memo is additionally written on the memo writing screen captured from the 1st mobile terminal 100-2. Yet, it is not always necessary for the memo to be additionally written on the memo writing screen in the 2nd mobile terminal 100-2, which is captured from the 1st mobile terminal 100-1. This is described in detail with reference to FIGS. 19 to 21 as follows.

FIG. 19 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention. FIG. 20 and FIG. 21 are diagrams of image messages transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention, respectively.

Referring to FIG. 19 (19-1), the 1st image message 501 in the display mode is being displayed as the 1st received message 613 on the 2nd touchscreen 600. In doing so, the 1st received message 613 may be in the display mode without being enlarged.

A 4th user command may be inputted to the 2nd mobile terminal 100-2. In this case, the 4th user command may be performed in a manner of pressing a specific hardware key button of the 2nd mobile terminal 100-2 when the 2nd user touches the 1st image message 501.

If so, the 2nd controller 180-2 may control the 1st image message 501 to enter the editing mode from the display mode without being enlarged.

Referring to FIG. 19 (19-2), the 2nd user may be able to handwrite a desired memo 721 onto the touchscreen 600. Moreover, it may be unnecessary for the desired memo 721 to be written on the 1st image message 501 that is not enlarged.

If so, referring to FIG. 19 (19-3), the 2nd controller 180 controls a 1st screen layer included in the 1st image message to become a memo background screen and also controls a new image message 702, on which the desired memo 721 is written, to be created on the memo background screen. In doing so, the 1st screen can be understood as entering the editing mode from the display mode if the specific hardware key button is inputted.

Although the desired memo is not written on the 1st image message, the 2nd controller 180-2 may be able to create a layer of the desired memo for the 1st screen layer as if the desired memo is automatically written on the 1st screen layer.

FIG. 20 shows the new image message 702 shown in FIG. 19 (19-3) in detail. The new image message 702 may include a 1st screen layer 510, a 1st memo layer 515 and a layer 725 of the desired memo.

Meanwhile, while the 1st received message 613 is in the display mode without being enlarged, a 5th user command

22

may be inputted to the 2nd mobile terminal 100-2. In particular, the 5th user command may be performed in a manner that the 2nd user presses the specific hardware key button of the mobile terminal without touching the touchscreen 600.

Subsequently, referring to FIG. 19 (19-2), the 2nd user may be able to input the desired memo 721 to the touchscreen 600 by handwriting.

If so, referring to FIG. 19 (19-4), the 2nd controller 180 controls a full screen (hereinafter named a 2nd screen) of the 2nd touchscreen 600, which is provided at the timing point of inputting the specific hardware key button, to become the memo background screen and also controls a new image 703, which includes the memo background screen and the desired memo 721 written thereon on. In particular, as the specific hardware key button is inputted, the 2nd screen may be understood as entering the editing mode from the display mode instead of the 1st screen.

FIG. 21 shows the new image message 703 shown in FIG. 19 (19-4) in detail. Referring to FIG. 21, the new image message 703 may include a 2nd screen layer 720 and a layer 725 of the desired memo.

According to the above description, when the specific hardware key button is pressed, either the 1st screen or the 2nd screen is selected depending on whether a prescribed image message is touched and selected from the 2nd touchscreen 600 and the selected screen then becomes the memo background screen, by which the present embodiment may be non-limited. This is described in detail with reference to FIG. 22 as follows.

FIG. 22 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 22 (22-1), after the hardware key button has been pressed without a touch to the 2nd touchscreen 600, the prescribed memo may start with a position on the 2nd touchscreen 600, on which the 1st image message 501 does not exist.

If so, referring to FIG. 22 (22-2), the 2nd controller 180 may control the 2nd screen to become a memo background screen for the new image message 703.

Alternatively, referring to FIG. 22 (22-3), after the hardware key button has been pressed without a touch to the 2nd touchscreen 600, the prescribed memo may start with a region on the 1st image message of the 2nd touchscreen 600.

If so, referring to FIG. 22 (22-4), the 2nd controller 180 may control the 1st screen to become a memo background screen for the new image message 703.

Besides, if a 4th user command is inputted within prescribed duration from the timing point of receiving the 1st image message 501, the 1st screen may become a memo background screen for the new image message 702 [not shown in the drawing]. Alternatively, if a 4th user command is inputted after prescribed duration from the timing point of receiving the 1st image message 501, the 2nd screen may become a memo background screen for the new image message 702 [not shown in the drawing].

According to the above description, if the mode of the 1st image message is switched to the editing mode from the display mode, all handwriting inputted on to the 1st image message is performed for the memo. Yet, it may be unnecessary for all the handwriting to be regarded as the memo. This is described in detail with reference to FIG. 23 and FIG. 24 as follows.

FIG. 23 and FIG. 24 are diagrams of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

23

Referring to FIG. 23 (23-1), the 1st image message 501 displayed on the 2nd touchscreen 600 is in the editing mode. In doing so, a desired handwriting 731 may be inputted.

Referring to FIG. 23 (23-2), after the desired handwriting 731 has been inputted, a handwriting 733 of a preset pattern may be performed on the desired handwriting 731. For instance, the handwriting 733 of the preset pattern for the desired handwriting 731 includes a handwriting of a closed curve pattern that encloses the desired handwriting 731.

Until the handwriting 733 of the preset pattern is additionally inputted, the desired handwriting 731 is the handwriting for the memo. Yet, the 2nd controller 180 may recognize the handwriting 733 of the preset pattern and the desired handwriting 731 additionally applied to the handwriting 733 of the preset pattern as a user command instead of recognizing the handwritings 733 and 731 as the handwritings for the memo.

In particular, the 2nd controller 180 recognizes the trace 'C' of the desired handwriting 731 and may then control a menu, which is previously set for the recognized trace, to be activated.

Referring to FIG. 23 (23-3), for instance, the preset menu includes a menu 630 for selecting a line color of the trace 'C' of the desired handwriting 731, or for selecting a line color for a next trace which will be created along a pointer touch drag after the line color is selected.

Alternatively, although the handwriting 733 of the preset pattern is not inputted in addition, if the handwriting 731 having the preset trace 'C' is inputted to the 1st image message in the editing mode, the 2nd controller 180 may control a menu, which corresponds to the preset trace or the next trace, to be activated in direct.

A process for activating a prescribed menu through a handwriting inputted onto a 1st image message in an editing mode is described in detail with reference to FIG. 24 as follows.

FIG. 24 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 24 (24-1), the 1st image message 501 displayed on the 2nd touchscreen 600 is in the editing mode. In doing so, a desired handwriting 735 for inputting a name of a prescribed person may be inputted.

Subsequently, referring to FIG. 24 (24-1), after the desired handwriting 735 has been inputted, a handwriting 733 of a preset pattern may be performed on the desired handwriting 735.

Until the handwriting 733 of the preset pattern is additionally inputted, the desired handwriting 735 is for the memo. Yet, the 2nd controller 180 may recognize the desired handwriting 735 and the handwriting 733 of the preset pattern additionally applied to the desired handwriting 735 as a user command instead of recognizing the handwritings 733 and 735 as the handwritings for the memo.

In particular, the 2nd controller 180 text-recognizes the trace 'Tom' of the desired handwriting 735, which is within the handwriting 733 of the preset pattern, as a counterpart and may then control a menu, which is previously set for the text-recognized counterpart, to be activated.

Referring to FIG. 24 (24-3), for instance, the preset menu includes a menu 633 for searching a 2nd memory 160-2 of the 2nd mobile terminal 100-2 for photo files, video files, still image files, music files, message files and the like, which are related to the text-recognized counterpart 'Tom', and then displaying the found files, collectively.

24

The found contact may be usable to transmit an image message to the found counterpart. And, the found file(s) may be attached to the image message transmitted to the found counterpart.

In the following description, a process for inputting a desired memo onto the 1st image message 501 in the editing mode is explained in detail with reference to FIG. 25.

FIG. 25 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 25 (25-1), the 1st image message 501 displayed on the 2nd touchscreen 600 is in the editing mode. And, a message input field 621 may be displayed together with the 1st image message 501 in the editing mode.

The 2nd user may be able to input a desired memo 739 to the message input field 621 by handwriting.

Subsequently, referring to FIG. 25 (25-2), the 2nd user may be able to touch and drag the inputted desired memo 739 to a desired position of the 1st image message 501 in the editing mode.

If so, referring to FIG. 25 (25-3), the 2nd controller 180-2 may be able to control the desired memo 739 inputted by handwriting to be shifted to and situated at the desired position of the 1st image message 501. Hence, the 2nd user may be able to easily determine a position, at which the desired memo 739 will be arranged, on the 1st image message 501.

Alternatively, referring to FIG. 25 (25-4), when the desired memo 739 is touched and dragged to the 1st image message 501, the 2nd controller 180-2 text-recognizes the desired handwriting, converts a type of the text-recognized desired memo not to a handwriting type but to a printing type according to a preset font, and then controls the type-converted desired memo 739 to be situated on the 1st image message 501.

Regarding the former description with reference to FIG. 14, the 3rd image message 503 may be transmitted to the 3rd mobile terminal 100-3 from the 1st mobile terminal 10-1. In the following description, the 3rd image message 503 displayed on the 3rd mobile terminal 100-3 is explained in detail with reference to FIG. 26.

FIG. 26 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 26 (26-1), the 3rd image message 503 may be displayed as a 3rd received message 917 on the 3rd touchscreen 900 of the 3rd mobile terminal 100-3. FIG. 26 (26-1) shows one example that the 3rd image message 503 in the display mode or the editing mode is enlarged and displayed on the 3rd touchscreen 900. Yet, as mentioned in the foregoing description, it is a matter of course that the 3rd image message 503 can be displayed together with other transmitted and/or received messages previously saved in the 3rd mobile terminal 100-3.

When the 3rd image message 503 is displayed, the 3rd controller 180-3 may be able to control identifiers 517, 527 and 537 of 1st to 3rd memos 511, 521 and 531 recorded in the 3rd image message 503 to be displayed on the 3rd touchscreen 900 as well. Although FIG. 26 shows one example that the identifiers 517, 527 and 537 are displayed on the 3rd image message 503, the identifiers 517, 527 and 537 may be displayable any place on the 3rd touchscreen 900.

The 1st identifier 517 may correspond to the 1st memo. The 2nd identifier 527 may correspond to the 2nd memo. And, the 3rd identifier may correspond to the 3rd memo.

The 1st to 3rd identifiers 517, 527 and 537 may be enumerated in order of the written time of each of the

25

corresponding memos. The 1st to 3rd identifiers **517**, **527** and **537** may be provided to select the corresponding memos, respectively. FIG. 26 (26-1) shows one example that the 1st to 3rd identifiers **517**, **527** and **537** are represented as names of writers of the corresponding memos, respectively. Alternatively, the 1st to 3rd identifiers **517**, **527** and **537** may be represented as indications (e.g., memo transmitted times, etc.) other than the writer names. Moreover, as mentioned in the foregoing description, each memo layer can be transmitted in a manner of containing a transmitted time information and a mobile terminal (or user) identifier information.

And, a select all icon 'All' **507** for selecting all of the 1st to 3rd memos **511**, **521** and **531** may be displayed together with the 1st to 3rd identifiers **517**, **527** and **537**.

FIG. 26 (26-1) shows one example that the select all icon **507** has been selected. Therefore, all the memos are simultaneously displayed on the 3rd image message **503**.

The 3rd user may be able to touch and select the 3rd identifier **537** for example.

If so, referring to FIG. 26 (26-2), the 3rd controller **180-3** may be able to control the 3rd memo **531**, which corresponds to the 3rd identifier **537**, to be displayed on the 3rd image message **503** only. Moreover, when the 3rd memo **531** is selectively displayed only, the 3rd controller **180-3** may be able to control a transmitted time information **539** of the 3rd memo **531** to be displayed on the 3rd touchscreen **900** together with the 3rd memo **531**.

Although FIG. 26 (26-2) shows one example that the transmitted time information **539** of the 3rd memo **531** is displayed on the 3rd image message **503**, the transmitted time information **539** may be displayable on any place on the 3rd touchscreen **900**.

When the 3rd identifier **537** is selected, it may be unnecessary for the 3rd memo **531** to be displayed only. For instance, while the 1st to 3rd memos are displayed, the 3rd memo **531** may be displayed in a manner of being visually identifiable from the rest of the memos.

Alternatively, after at least two identifiers have been simultaneously selected, at least two memos corresponding to the selected identifiers are displayed only or may be displayed in a manner of being visually identifiable only.

It may be unnecessary for the identifiers to be used only to view a desired one of the 1st to 3rd memos selectively. This is described in detail with reference to FIG. 27 as follows.

FIG. 27 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 27 (27-1), the 3rd image **503** may be displayed as a 3rd received message **917** on the 3rd touchscreen **900** of the 3rd mobile terminal **100-3**. And, the 1st to 3rd memos **511**, **521** and **531** may be displayed on the 3rd image message **503** together with the corresponding identifiers.

In doing so, referring to FIG. 27 (27-2), after the 2nd identifier **527** has been touched and selected by the 3rd user, a 4th memo **541** may be handwritten on the 3rd image message **503** in the editing mode. Subsequently, an icon 'Send' **923** may be touched and selected by the 3rd user.

In response to the selected 2nd identifier **527**, the written 4th memo **541** and the selected icon 'Send' **923**, the 3rd controller **180-3** creates a 3rd image message (hereinafter named a 4th image message **504**) having the 4th memo **541** written thereon and may be then able to control the 4th image message **504** to be transmitted only to the 2nd mobile terminal **100-2** corresponding to the 2nd identifier **527** (i.e.,

26

the 2nd mobile terminal in which the 2nd memo corresponding to the 2nd identifier is written).

A process for the 4th image message **504** to be transmitted from the 3rd mobile terminal **100-3** to the 2nd mobile terminal **100-2** only is described in detail with reference to FIG. 28 as follows.

FIG. 28 is a diagram of an image message transmitted by a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 28, the 4th image message **504** may include a 1st screen layer **510** containing a 1st screen (i.e., a memo screen screen), a 1st memo layer **515** containing a 1st memo **511**, a 2nd memo layer **525** containing a 2nd memo **521**, a 3rd memo layer **535** containing a 3rd memo **531**, and a 4th memo layer **545** containing a 4th memo **541**. In particular, the 4th memo layer **545** may include at least one of a time of transmitting the 4th memo layer **545** and a 3rd mobile terminal identifier information (or a 3rd user identifier information) on a 3rd mobile terminal having the 4th memo **541** written therein.

In the following description, when the 3rd mobile terminal **100-3** is in a touchscreen locked state or a touchscreen off-state, a process for receiving the 3rd image message **503** is explained in detail with reference to FIG. 29.

FIG. 29 is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. 29 (29-1), the 3rd mobile terminal **100-3** may be in a touchscreen locked mode. Referring to FIG. 29 (29-2), the 3rd mobile terminal **100-3** may be in a touchscreen off-mode.

In this case, the touchscreen locked mode may mean the mode in which a limited preset touch limited can be inputted only in order to prevent an incorrectly manipulated touch to the touchscreen. And, the touchscreen off-mode may mean the mode in which the touchscreen does not output any information by turning off a supply power of the touchscreen to minimize power loss despite that a power of the 3rd mobile terminal **100-3** is turned on and in which the touchscreen is unable to receive an input of any touch. Generally, while the mobile terminal **100** is in the touchscreen locked mode, if any user input is not made for prescribed duration, the touchscreen off-mode can be automatically entered.

While the 3rd mobile terminal **100-3** is in the touchscreen locked mode, the 3rd controller **180-3** may control an unlock icon **939**, which is provided to cancel the touchscreen locked mode, to be displayed on the 3rd touchscreen **900**. If the unlock icon **939** is dragged along a prescribed trace, the 3rd controller **180-3** may control the 3rd mobile terminal **100-3** to be released from the locked mode.

While the 3rd mobile terminal **100-3** is in the touchscreen locked mode or the touchscreen off-mode, it may be able to receive the 3rd image message **503**.

If so, referring to FIG. 29 (29-3), the 3rd controller **180-3** controls the 3rd mobile terminal **100-3** to stay in the touchscreen locked mode and may also control the 1st screen layer **510** to be displayed on the 3rd touchscreen **900** only in a manner that the 1st to 3rd memo layers in the received 3rd image message **503** are not displayed on the 3rd touchscreen **900**. This is to protect the privacy of the 3rd user of the 3rd mobile terminal **100-3**. If the touchscreen locked mode is cancelled, the 3rd controller **180-3** may be able to control the 1st to 3rd memo layers to be displayed in a manner of overlapping with the 3rd image message.

Alternatively, referring to FIG. 29 (29-4), the 3rd controller **180-3** controls the 3rd mobile terminal **100-3** to stay in the touchscreen locked mode and may also control the identi-

27

fiers **517**, **527** and **537** of the 1st to 3rd memos to be displayed on the 1st screen layer **510** by displaying the 1st screen layer **510** on the 3rd touchscreen **900** only in a manner that the 1st to 3rd memo layers in the received 3rd image message **503** are not displayed on the 3rd touchscreen **900**. If the touchscreen locked mode is cancelled, the 3rd controller **180-3** may control the 1st to 3rd memo layers to be displayed together with the identifiers in a manner of overlapping with the 3rd image message.

In the following description, when the 3rd mobile terminal **100-3** is in the touchscreen locked state or the touchscreen off-state, a process for receiving the 3rd image message **503** is explained in detail with reference to FIG. **30**.

FIG. **30** is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. **30** (**30-1**), when the 3rd mobile terminal **100-3** is in the touchscreen locked state or the touchscreen off-state, if the 3rd mobile terminal **100-3** receives the 3rd image message **503**, the 3rd controller **180-3** may control the mobile terminal **100-3** to stay in the touchscreen locked state and may also control the 3rd image message **503** to be displayed as a portion of the touchscreen locked screen on the 3rd touchscreen **900**.

And, referring to FIG. **30** (**30-1**), the 3rd controller **180-3** may be able to control the 1st to 3rd identifiers **517**, **527** and **537**, which correspond to the 1st to 3rd memos **511**, **521** and **531**, respectively, to be displayed on the 3rd image message **503**.

In doing so, a 6th user command for selecting one (e.g., the 2nd identifier) of the 1st to 3rd identifiers may be inputted. In this case, the 6th user command may include a long touch to the 2nd identifier **527**, by which the present embodiment may be non-limited.

If so, referring to FIG. **30** (**30-2**), the 3rd controller **180-3** may be able to control a message writing window **950**, which is provided to write a message to be transmitted to the 2nd mobile terminal (or the 2nd user) corresponding to the 2nd identifier, to be displayed in response to the 6th user command.

Subsequently, the 3rd user writes a desired memo on the message writing window **950** by handwriting and may be then able to touch and select an icon 'Send' **953**.

If so, the 3rd controller **180-3** may be able to control the written memo to be transmitted to the 2nd mobile terminal **100-2** only.

FIG. **31** is a diagram of display screen configurations of implementing a method of controlling a mobile terminal according to an embodiment of the present invention.

Referring to FIG. **31** (**31-1**), after the 1st mobile terminal **100-1** has transmitted the 3rd image message **503**, the 3rd image message **503** may be displayed as a 3rd transmitted message **417** on a chat window for a chat with the 2nd user.

Thereafter, a 3rd user command may be inputted to enlarge and display the 3rd transmitted message **417**.

If so, referring to FIG. **31** (**31-2**), the 1st controller **180-1** may be able to control the 3rd transmitted message **417** to be displayed by being enlarged. And, the 1st controller **180-1** may be able to control a text message convert icon **409** to be displayed with the enlarged 3rd transmitted message **417**.

If the 1st user touches and selects the text message convert icon **409**, referring to FIG. **31** (**31-3**), the 1st controller **180-1** converts the 1st to 3rd memos **511**, **521** and **531** in the 3rd image message **503** to text messages and may then control the text messages to be displayed as the 1st transmitted message **413**, the 2nd received message **415** and the 3rd transmitted message **417** on the chat window, respectively.

28

Optionally, the 1st transmitted message **413**, the 2nd received message **415** and the 3rd transmitted message **417** may be displayed in a manner of being sorted or arranged on the chat window in order of the corresponding transmitted or received time.

Accordingly, embodiments of the present invention provide various effects and/or features.

According to at least one of embodiments of the present invention, a user unfamiliar with key buttons is able to conveniently perform a communication with a counterpart through messages.

In particular, even if a user does not press a key button, a message communication with a counterpart can be performed in a manner that the user handwrites and sends a memo to the counterpart. In the course of the ongoing message communication, the user writes a memo on an image received from the counterpart and then sends the written memo back to the counterpart.

And, in the course of the ongoing message communication, the user is able to conveniently view a memo written image from the counterpart. Moreover, in the course of the ongoing message communication, the user further writes his memo on the image having a memo written thereon by the counterpart and is then able to transmit the corresponding memo to the counterpart.

It will be apparent to those skilled in the art that the present invention can be specified into other form(s) without departing from the spirit or scope of the inventions.

According to the above descriptions, images messages are transceived among 1st to 3rd mobile terminals. Since a prescribed embodiment related to one of the mobile terminals is apparently applicable to the rest of the mobile terminals, the repetitive contents shall be omitted from the present specification. In particular, embodiments related to the 1st mobile terminal are applicable to the 2nd or 3rd mobile terminal, embodiments related to the 2nd mobile terminal are applicable to the 1st or 3rd mobile terminal, and embodiments related to the 3rd mobile terminal are applicable to the 1st or 2nd mobile terminal.

In addition, the above-described methods can be implemented in a program recorded medium as computer-readable codes. The computer-readable media may include all kinds of recording devices in which data readable by a computer system are stored. The computer-readable media may include ROM, RAM, CD-ROM, magnetic tapes, floppy discs, optical data storage devices, and the like for example and also include carrier-wave type implementations (e.g., transmission via Internet). Further, the computer may include the controller **180** of the terminal.

It will be appreciated by those skilled in the art that various modifications and variations can be made in the present invention without departing from the spirit or scope of the inventions. Thus, it is intended that the present invention covers the modifications and variations of this invention provided they come within the scope of the appended claims and their equivalents.

What is claimed is:

1. A mobile terminal comprising:
a touchscreen;

a wireless communication unit configured to perform a wireless communication with at least one or more external terminals including a 1st external terminal; and
a controller configured to:
display a 1st image message including an image received from the 1st external terminal on the touchscreen

29

together with at least one of a previously saved transmitted message and a previously saved received message,

in response to a 1st user command inputted in the course of displaying the 1st image message, control a 1st memo to be written on the image of the received 1st image message,

in response to reception of a 2nd user command, control a 2nd image message including the image having the 1st memo written thereon to be transmitted to the 1st external terminal, wherein the 2nd image message comprises an image layer including the received image and a 1st memo layer including the 1st memo,

transmit the image layer and the 1st memo layer as the 2nd image message to the 1st external terminal,

receive a 3rd image message comprising the image layer, the 1st memo layer and a 2nd memo layer created by the 1st external terminal from the 1st external terminal,

display the image layer, the 1st memo layer and the 2nd memo layer as the 3rd image message on the touchscreen in a manner of overlapping with each other, and

in response to the 1st user command inputted in the course of displaying the 3rd image message, control a 3rd memo to be written on the 3rd image message,

wherein if the 1st user command is inputted within a first prescribed duration after reception of the 3rd image message, the controller controls a 2nd memo included in the 2nd memo layer only to be displayed on the image in the course of writing the 3rd memo,

wherein if the 1st user command is inputted after the first prescribed duration from a time of the reception of the 3rd image message, the controller controls both of the 1st memo and the 2nd memo to be displayed on the image in the course of writing the 3rd memo, and

wherein if the 2nd user command is inputted, the controller controls the 3rd image message, which comprises the image, the 1st memo layer, the 2nd memo layer and a 3rd memo layer, to be transmitted to the 1st external terminal irrespective of whether the 1st memo is displayed.

2. The mobile terminal of claim 1, wherein the controller controls both of the 1st image message and the 2nd image message to be displayed together after the 2nd image message has been transmitted.

3. The mobile terminal of claim 2, wherein while the received image is in a display mode, the controller controls the received image to be displayed on the touchscreen together with at least one of a previously saved transmitted message and a previously saved received message, and

wherein while the received image is in an editing mode, the controller controls the 1st memo to be written on the received image.

4. The mobile terminal of claim 3, wherein if a touch gesture is performed on the received image in the display mode, the controller controls the received image to enter the editing mode from the display mode by being enlarged.

5. The mobile terminal of claim 3, wherein if a touch gesture is performed on the touchscreen with a pointer having a 1st thickness, the controller controls the received image to stay in the display mode, and

wherein if the touch gesture is performed on the touchscreen with the pointer having a 2nd thickness, the controller controls the received image to enter the editing mode from the display mode.

30

6. The mobile terminal of claim 3, wherein the controller controls one selected by a user between the received image and a full screen of the touchscreen to enter the editing mode, and

wherein if the full screen enters the editing mode, the controller controls the 1st memo to be written on an image of the full screen.

7. The mobile terminal of claim 3, wherein after the received image has entered the editing mode, the controller controls a 1st user handwriting to be inputted onto the touchscreen, and

wherein after the 1st user handwriting has been inputted, if a previously set 2nd user handwriting is inputted, the controller controls the 1st user handwriting to be recognized as a user command for activating a prescribed menu corresponding to the 1st user handwriting.

8. The mobile terminal of claim 3, wherein after the received image has entered the editing mode, the controller controls a 1st handwriting to be inputted onto the touchscreen, and

wherein if a trace of the 1st user handwriting is a preset trace, the controller controls the 1st user handwriting to be recognized as a user command for activating a prescribed menu corresponding to the 1st user handwriting.

9. The mobile terminal of claim 6, further comprising at least one of hardware and software key buttons, wherein after the received image has been selected, if the key button is pressed, the controller controls the received image to enter the editing mode and wherein if the key button is pressed without selecting the received image, the controller controls the full screen to enter the editing mode.

10. The mobile terminal of claim 6, wherein after the 1st user command has been inputted, if a user handwriting for writing the 1st memo starts with a region on the received image, the controller controls the received image to enter the editing mode, and

wherein after the 1st user command has been inputted, if the user handwriting for writing the 1st memo starts with a region other than the received image, the controller controls the full screen to enter the editing mode.

11. The mobile terminal of claim 6, wherein if the 1st user command is inputted within a second prescribed duration after reception of the 1st image message, the controller controls the received image to enter the editing mode, and wherein if the 1st user command is inputted after the second prescribed duration from a time of the reception of the 1st image message, the controller controls the full screen to enter the editing mode.

12. The mobile terminal of claim 2, wherein when the 2nd user command is inputted, the controller further controls a 4th image message including the 1st memo written image of the full screen to be transmitted to the 1st external terminal.

13. The mobile terminal of claim 1, wherein each of the 1st memo layer and the 2nd memo layer includes information on its corresponding creation time, and

wherein if a prescribed time expires from the corresponding creation time, the controller controls each of the 1st memo layer and the 2nd memo layer to gradually or instantly disappear from the touchscreen.

14. The mobile terminal of claim 1, wherein when a number of memo layers cumulated on the image layer is equal to or greater than a predetermined number, the controller controls an oldest memo layer among the memo layers to disappear from the touchscreen gradually or instantly.

31

15. The mobile terminal of claim 1, wherein the 1st image message comprises a 4th memo layer including a 4th memo previously created by a 2nd external terminal when the 1st image message is received by the mobile terminal, wherein after the 2nd memo has been selected, if the 3rd memo is written, when the 2nd user command is inputted, the controller controls a 4th image message comprising the image layer and the 1st to 4th memo layers to be transmitted to the 1st external terminal, and wherein after the 4th memo has been selected, if the 3rd memo is written, when the 2nd user command is inputted, the controller controls the 4th image message to be transmitted to the 2nd external terminal.

16. A method of controlling a mobile terminal, the method comprising:

- performing a wireless communication with at least one or more external terminals including a 1st external terminal;
- displaying a 1st image message including an image received from the 1st external terminal on a touchscreen together with at least one of a previously saved transmitted message and a previously saved received message;
- in response to a 1st user command inputted in the course of displaying the 1st image message, controlling a 1st memo to be written on the image of the received 1st image message;
- in response to reception of a 2nd user command, controlling a 2nd image message including the image having the 1st memo written thereon to be transmitted to the 1st external terminal, wherein the 2nd image message com-

32

- prises an image layer including the received image and a 1st memo layer including the 1st memo;
- transmitting the image layer and the 1st memo layer as the 2nd image message to the 1st external terminal;
- receiving a 3rd image message comprising the image layer, the 1st memo layer and a 2nd memo layer created by the 1st external terminal from the 1st external terminal;
- displaying the image layer, the 1st memo layer and the 2nd memo layer as the 3rd image message on the touchscreen in a manner of overlapping with each other; and
- in response to the 1st user command inputted in the course of displaying the 3rd image message, controlling a 3rd memo to be written on the 3rd image message,

wherein the method further comprises:

- if the 1st user command is inputted within a prescribed duration after reception of the 3rd image message, controlling a 2nd memo included in the 2nd memo layer only to be displayed on the image in the course of writing the 3rd memo;
- if the 1st user command is inputted after the prescribed duration from a time of the reception of the 3rd image message, controlling both of the 1st memo and the 2nd memo to be displayed on the image in the course of writing the 3rd memo; and
- if the 2nd user command is inputted, the controller controls the 3rd image message, which comprises the image, the 1st memo layer, the 2nd memo layer and a 3rd memo layer, to be transmitted to the 1st external terminal irrespective of whether the 1st memo is displayed.
